Dataframe

A DataFrame in R is a tabular (i.e., 2-dimensional, rectangular) data structure used to store values of any data type.

It's a data structure of the base R, meaning that we don't have to install any specific package to create DataFrames and work with it.

As with any other table, every DataFrame consists of columns (representing variables, or attributes) and rows (representing data entries).

Speaking in terms of R, a dataframe is a list of vectors of equal length, and, being at the same time a 2-dimensional data structure, it resembles an R matrix differing from it in the following way:

a matrix has to contain only one data type while a DataFrame is more versatile since it can have multiple data types.

However, while different columns of a DataFrame can have different data types, each column should be of the same data type.

Dataframe is a special kind of list in which the elements are of same length.

Characteristics of R Data Frame

Now, let's discuss the characteristics of data frame in R.

The column names should be non-empty.

The row names should be unique.

The data frame can hold the data which can be a numeric, character or of factor type. Each column should contain the same number of data items.

Creating a Dataframe in R from Vectors

To create a DataFrame in R from one or more vectors of the same length, we use the data.frame() function. Its most basic syntax is as follows:

df <- data.frame(vector 1, vector 2)</pre>

```
In [1]: vec1 = c(12L,13L,14L)
vec2 = c(34L,35L,36L)
vec3= c(45L,46L,47L)
```

```
In [2]: df <- data.frame(vec1, vec2, vec3)</pre>
```

```
vec1 vec2 vec3
               12
                    34
                         45
               13
                    35
                         46
               14
                    36
                         47
    In [4]:
             class(df)
             'data.frame'
give name to the columns in dataframe
             df <- data.frame("A" =vec1, "B" = vec2, "C" =vec3 )</pre>
    In [6]:
             df
              Α
             12 34 45
             13 35 46
             14 36 47
    In [7]: str(df) # To display the structure of the dataframe
             'data.frame':
                              3 obs. of 3 variables:
              $ A: int
                        12 13 14
              $ B: int
                        34 35 36
              $ C: int
                        45 46 47
    In [8]: names(df) # to display the column names
             'A' 'B' 'C'
    In [9]: nrow(df)
             3
   In [10]: ncol(df)
             3
   In [11]:
             summary(df)
                                    В
                                                    С

                              Max.
                                     :36.0
                                              Max.
                                                     :47.0
```

In [3]:

METHOD 1

One way to create an R DataFrame from vectors is to create each vector first and then pass them all in the necessary order to the data.frame() function:

```
In [12]: | rating <- 1:4</pre>
          animal <- c('koala', 'hedgehog', 'sloth', 'panda')</pre>
          country <- c('Australia', 'Italy', 'Peru', 'China')</pre>
          avg_sleep_hours <- c(21, 18, 17, 10)</pre>
          super_sleepers <- data.frame(rating, animal, country, avg_sleep_hours)</pre>
          print(super_sleepers)
            rating
                     animal
                               country avg_sleep_hours
          1
                       koala Australia
          2
                 2 hedgehog
                                 Italy
                                                      18
          3
                 3
                       sloth
                                  Peru
                                                      17
          4
                 4
                       panda
                                 China
                                                      10
In [13]:
          summary(super_sleepers)
               rating
                                animal
                                              country avg_sleep_hours
                                         Australia:1
           Min.
                  :1.00
                           hedgehog:1
                                                        Min.
                                                              :10.00
           1st Qu.:1.75
                                                        1st Qu.:15.25
                           koala
                                   :1
                                         China
                                                   :1
           Median :2.50
                           panda
                                    :1
                                         Italy
                                                   :1
                                                        Median :17.50
           Mean
                 :2.50
                           sloth
                                    :1
                                         Peru
                                                   :1
                                                        Mean
                                                               :16.50
           3rd Qu.:3.25
                                                        3rd Qu.:18.75
           Max.
                 :4.00
                                                        Max.
                                                               :21.00
```

METHOD 2

provide all the vectors directly in the following function

```
In [14]: | super_sleepers <- data.frame(rating = 1:4,</pre>
                                         animal=c('koala', 'hedgehog', 'sloth', 'panda'),
                                         country=c('Australia', 'Italy', 'Peru', 'China'),
                                         avg_sleep_hours=c(21, 18, 17, 10))
          print(super_sleepers)
            rating
                     animal
                               country avg_sleep_hours
          1
                      koala Australia
                 1
                                                     21
          2
                 2 hedaehoa
                                 Italv
                                                     18
          3
                 3
                                  Peru
                                                     17
                      sloth
          4
                 4
                      panda
                                 China
                                                     10
In [15]:
          print(class(super_sleepers))
          [1] "data.frame"
```

explore its structure

It's possible to add also the names of rows of a DataFrame (by default, the rows are just indexed as consecutive integer numbers starting from 1). For this purpose, we use an optional parameter row.names, as follows:

```
In [17]: | super_sleepers <- data.frame(rating=1:4,</pre>
                                        animal=c('koala', 'hedgehog', 'sloth', 'panda'),
                                        country=c('Australia', 'Italy', 'Peru', 'China'),
                                        avg_sleep_hours=c(21, 18, 17, 10),
                                        row.names=c('row_1', 'row_2', 'row_3', 'row_4'))
          print(super_sleepers)
                rating
                         animal
                                   country avg_sleep_hours
         row_1
                          koala Australia
                                                         21
                     2 hedgehog
                                                         18
         row_2
                                     Italy
                     3
                          sloth
                                      Peru
                                                         17
         row_3
```

10

Note than in an R DataFrame, both the column names and row names (if they exist) have to be unique. If, by mistake, we provide the same name for two columns, R will automatically add a suffix to the second of them

China

```
# Adding by mistake 2 columns called 'animal'
In [18]:
          super_sleepers <- data.frame(animal=1:4,</pre>
                                        animal=c('koala', 'hedgehog', 'sloth', 'panda'),
                                        country=c('Australia', 'Italy', 'Peru', 'China'),
                                        avg_sleep_hours=c(21, 18, 17, 10))
         print(super_sleepers)
           animal animal.1
                              country avg_sleep_hours
         1
                      koala Australia
                 1
                                                    21
         2
                 2 hedgehog
                                Italy
                                                    18
         3
                 3
                      sloth
                                 Peru
                                                    17
```

10

If, instead, we make a similar mistake with the row names, the program will throw an error:

China

row_4

4

4

panda

4

panda

```
In [19]: | # Naming by mistake 2 rows 'row_1'
         super_sleepers <- data.frame(rating=1:4,</pre>
                                       animal=c('koala', 'hedgehog', 'sloth', 'panda'),
                                       country=c('Australia', 'Italy', 'Peru', 'China'),
                                       avg_sleep_hours=c(21, 18, 17, 10),
                                       row.names=c('row_1', 'row_1', 'row_3', 'row_4'))
         print(super_sleepers)
         Error in data.frame(rating = 1:4, animal = c("koala", "hedgehog", "sloth", : dup
         licate row.names: row_1
         Traceback:
         1. data.frame(rating = 1:4, animal = c("koala", "hedgehog", "sloth",
                 "panda"), country = c("Australia", "Italy", "Peru", "China"),
                 avg_sleep_hours = c(21, 18, 17, 10), row.names = c("row_1", 10)
                     "row_1", "row_3", "row_4"))
         2. stop(gettextf("duplicate row.names: %s", paste(unique(row.names[duplicated(ro
         w.names)]),
                collapse = ", ")), domain = NA)
In [20]:
        #rename the columns of a DataFrame after its creation using the names() functio
         names(super_sleepers) <- c('col_1', 'col_2', 'col_3', 'rcol_4')</pre>
         print(super_sleepers)

Creating a Dataframe in R from a Matrix

It's possible to create an R DataFrame from a matrix. However, in this case, all the values of a new DataFrame will be of the same data type.

Unfortunately, in this case, there is no way to change the column names directly inside the function using some optional parameters (while, ironically, we still can rename the rows by using the row.names parameter). Since the default column names aren't descriptive (or at least meaningful), we have to fix it after creating the DataFrame by applying the names() function:

Creating a Dataframe in R from a List of Vectors

```
In [24]:
         my_list <- list(rating=1:4,</pre>
                          animal=c('koala', 'hedgehog', 'sloth', 'panda'),
                          country=c('Australia', 'Italy', 'Peru', 'China'),
                          avg_sleep_hours=c(21, 18, 17, 10))
         print(my_list)
         $rating
         [1] 1 2 3 4
         $animal
         [1] "koala"
                         "hedgehog" "sloth"
                                                "panda"
         $country
         [1] "Australia" "Italy"
                                       "Peru"
                                                   "China"
         $avg_sleep_hours
         [1] 21 18 17 10
In [25]: #create a DataFrame from it:
         super_sleepers <- data.frame(my_list)</pre>
         print(super_sleepers)
                              country avg_sleep_hours
           rating
                     animal
         1
                      koala Australia
                                                    21
         2
                 2 hedgehog
                                Italy
                                                    18
```

Creating a Dataframe in R from Other Dataframes

3

4

sloth

panda

Peru

China

3

4

```
In [26]: | #Let's say we have a DataFrame containing only the first two columns of our sup
         er_sleepers table:
          super_sleepers_1 <- data.frame(rating=1:4,</pre>
                                          animal=c('koala', 'hedgehog', 'sloth', 'panda'))
         print(super_sleepers_1)
            rating
                     animal
         1
                 1
                      koala
         2
                 2 hedgehog
         3
                      sloth
                 3
         4
                 4
                      panda
In [27]: #The second 2 columns of super_sleepers are saved in another dataframe:
          super_sleepers_2 <- data.frame(country=c('Australia', 'Italy', 'Peru', 'China'</pre>
          ),
                                          avg_sleep_hours=c(21, 18, 17, 10))
         print(super_sleepers_2)
              country avg_sleep_hours
         1 Australia
         2
                Italy
                                    18
         3
                 Peru
                                    17
```

Now, we'll apply the cbind() function to concatenate both DataFrames and get the initial super_sleepers DataFrame:

10

Note that in order to perform the above operation successfully, the DataFrames must have the same number of rows; otherwise, we'll get an error.

```
In [28]: super_sleepers <- cbind(super_sleepers_1, super_sleepers_2)</pre>
          print(super_sleepers)
            rating
                     animal
                               country avg_sleep_hours
         1
                      koala Australia
                                                      21
                 1
         2
                 2 hedgehog
                                                      18
                                 Italy
         3
                 3
                      sloth
                                  Peru
                                                     17
                 4
                                 China
                                                      10
                      panda
```

Similarly, to combine DataFrames vertically (i.e., adding the rows of one DataFrame to the rows of the other), we use the rbind() function, where we pass the necessary dataFrames.

Let's say we have a DataFrame containing only the first two rows of super_sleepers:

4

China

```
super_sleepers_1 <- data.frame(rating=1:2,</pre>
                                 animal=c('koala', 'hedgehog'),
                                 country=c('Australia', 'Italy'),
                                 avg_sleep_hours=c(21, 18))
print(super_sleepers_1)
  rating
           animal
                     country avg_sleep_hours
            koala Australia
1
       1
                                           21
2
       2 hedgehog
                                           18
                       Italy
```

```
In [30]:
         #Another DataFrame contains the last two rows of super_sleepers:
          super_sleepers_2 <- data.frame(rating=3:4,</pre>
                                          animal=c('sloth', 'panda'),
                                          country=c('Peru', 'China'),
                                          avg_sleep_hours=c(17, 10))
         print(super_sleepers_2)
            rating animal country avg_sleep_hours
         1
                 3
                    sloth
                              Peru
                                                 17
         2
                 4
                    panda
                             China
                                                 10
In [31]:
         super_sleepers <- rbind(super_sleepers_1, super_sleepers_2)</pre>
         print(super_sleepers)
            rating
                     animal
                               country avg_sleep_hours
         1
                      koala Australia
                 1
         2
                 2 hedgehog
                                                     18
                                 Italy
         3
                 3
                      sloth
                                  Peru
                                                     17
```

Reading a DataFrame in R from a CSV File

4

panda

China

4

Apart from creating a DataFrame in R from scratch, we can import an already existing dataset in a tabular form and save it as a DataFrame. Indeed, this is the most common way to create an R DataFrame for real-world tasks.

To see how it works, let's download a Kaggle dataset Oranges vs. Grapefruit on our local machine, save it in the same folder as this notebook, read it as a new DataFrame citrus, and visualize the first six rows of the DataFrame. Since the original dataset exists as a csv file, we'll use the read.csv() function to read it:

In [32]: citrus <- read.csv("C:/Users/Venkat/citrus.csv")
 print(citrus)</pre>

	name	diameter	weight	red	green	blue
1	orange	2.96	86.76	172	85	2
2	orange	3.91	88.05	166	78	3

```

Note: it's not mandatory to save the downloaded file in the same folder as the working notebook. If the file is saved in another place, we simply need to provide the entire path to it instead of just the file's name (e.g.,

'C:/Users/User/Downloads/citrus.csv'). However, saving the dataset file in the same file as the working R notebook is a good practice.

Access Dataframe Items

We can use single brackets [], double brackets [[]] or \$ to access columns from a data frame:

```
In [33]: Data_Frame <- data.frame (
    Training = c("Strength", "Stamina", "Other"),
    Pulse = c(100, 150, 120),
    Duration = c(60, 30, 45)
)

Data_Frame</pre>
```

Training	Pulse	Duration
Strength	100	60
Stamina	150	30
Other	120	45

```
In [34]: Data_Frame[1]
```

Training Strength Stamina

Other

Expand R Data Frame/ Updating DataFrame

Add Rows

Use the rbind() function to add new rows in a Data Frame:

Training	Pulse	Duration
Strength	100	60
Stamina	150	30
Other	120	45
Strength	110	110

Add Columns

Use the cbind() function to add new columns in a Data Frame:

In [42]:	# Print the new column
	New_col_DF

Training	Pulse	Duration	Steps
Strength	100	60	1000
Stamina	150	30	6000
Other	120	45	2000

Remove Rows and Columns

Use the c() function to remove rows and columns in a Data Frame:

```
In [43]: Data_Frame <- data.frame (
    Training = c("Strength", "Stamina", "Other"),
    Pulse = c(100, 150, 120),
    Duration = c(60, 30, 45)
)

Data_Frame</pre>
```

Training	Pulse	Duration
Strength	100	60
Stamina	150	30
Other	120	45

```
In [44]: # Remove the first row and column
Data_Frame_New <- Data_Frame[-c(1), -c(1)]</pre>
```

```
In [45]: # Print the new data frame
Data_Frame_New
```

	Pulse	Duration
2	150	30
3	120	45

Merging Data Frames

Use the rbind() function to combine two or more data frames in R vertically:

Training	Pulse	Duration	
Strength	100	60	
Stamina	150	30	
Other	120	45	
Stamina	140	30	
Stamina	150	30	
Strength	160	20	

And use the cbind() function to combine two or more data frames in R horizontally:

```
In [47]: Data_Frame3 <- data.frame (
    Training = c("Strength", "Stamina", "Other"),
    Pulse = c(100, 150, 120),
    Duration = c(60, 30, 45)
)

Data_Frame4 <- data.frame (
    Steps = c(3000, 6000, 2000),
    Calories = c(300, 400, 300)
)

New_Data_Frame1 <- cbind(Data_Frame3, Data_Frame4)
New_Data_Frame1</pre>
```

Training	Pulse	Duration	Steps	Calories
Strength	100	60	3000	300
Stamina	150	30	6000	400
Other	120	45	2000	300

Delete Data Frames in R

In [53]: tail(New_Data_Frame1)

The R programming language offers two helpful functions for viewing and removing objects within an R workspace:

```
ls(): List all objects in current workspace
```

rm(): Remove one or more objects from current workspace

'super sleepers 2' 'vec1' 'vec2' 'vec3'

Delete a Single Data Frame

The following code shows how to delete a single data frame from your current R workspace:

```
In [56]: #list all objects in current R workspace
ls()

'animal' 'avg_sleep_hours' 'citrus' 'country' 'Data_Frame' 'Data_Frame_New' 'Data_Frame1'
'Data_Frame2' 'Data_Frame3' 'Data_Frame4' 'df' 'df_from_matrix' 'my_list' 'my_matrix'
'New_col_DF' 'New_Data_Frame' 'New_Data_Frame1' 'New_row_DF' 'rating' 'super_sleepers'
'super_sleepers_1' 'super_sleepers_2' 'vec1' 'vec2' 'vec3'

In [57]: #remove df1
rm('New_Data_Frame1')

In [58]: ls()
```

'animal' 'avg sleep hours' 'citrus' 'country' 'Data Frame' 'Data Frame_New' 'Data Frame1'

'Data_Frame2' 'Data_Frame3' 'Data_Frame4' 'df' 'df_from_matrix' 'my_list' 'my_matrix' 'New col DF' 'New Data Frame' 'New row DF' 'rating' 'super sleepers' 'super sleepers 1'

The following code shows how to delete multiple data frames from your current R workspace:

```
In [59]: rm("Data_Frame3", "Data_Frame4")
```

Delete All Data Frames
